

## Cloud Services

Elevate Your Transformation and Cloud With Us

Ayukul Technologies provide a smoother transition for your company's migration to cloud services. We keep the cost minimum and impact maximum so that your return on investments are justified.

### Who Are We?

Ayukul Technologies specializes in Managed IT Services and Cloud Infrastructure services ranging from the development of cloud solutions, storage and infrastructure management, backup & camera solutions, virtual desktop infrastructure setups, and networking.

We take pride in our strategic alliance with JIGHI Inc, one of the prime technology solution providers globally.

### Our Services

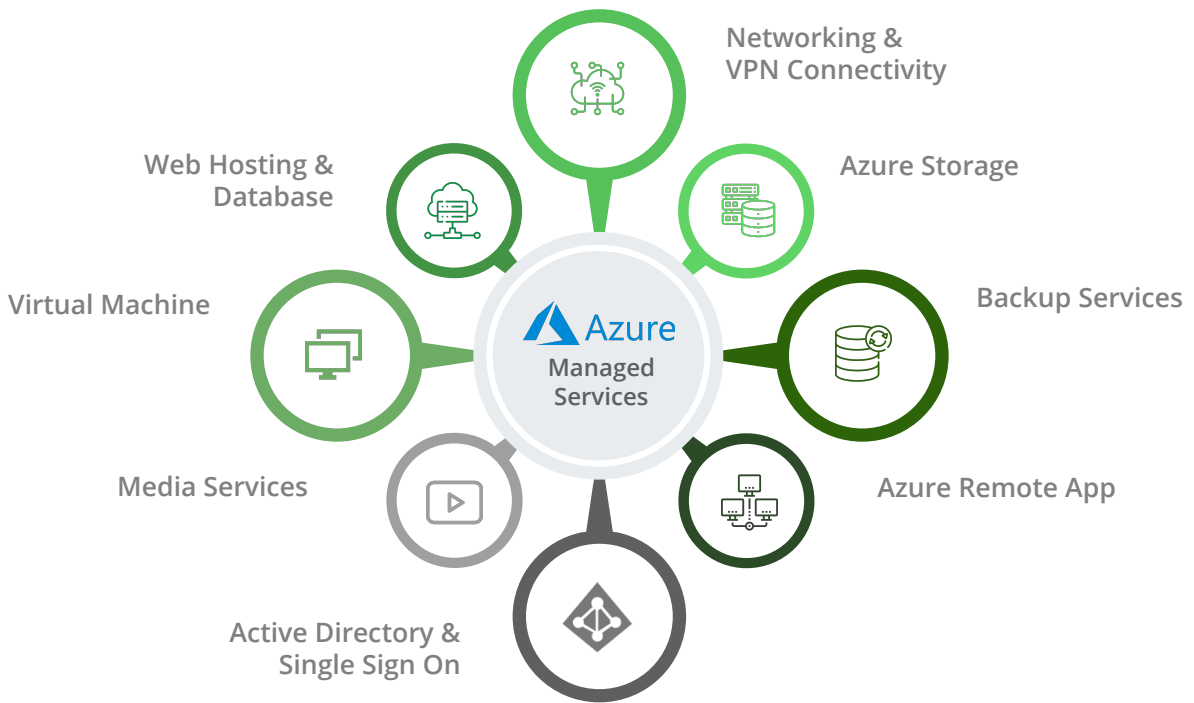

#### AWS Managed Services

AWS (Amazon Web Services) is the world's one of the most comprehensively used cloud platform. Millions of enterprises, including some of the fastest-growing start-ups, Scaled up companies, and leading government agencies use AWS for cost economics to become more nimble and innovate smoothly.

## AWS Managed Services

Azure is a cloud service offered by Microsoft for building, deploying, testing, and managing application & services through MS managed data centers. Its ability to provide SaaS, PaaS, and IaaS makes it desirable for Start-ups and Enterprises alike. It supports many programming languages, tools, and frameworks, including those specific to Microsoft and third-party systems.

## Why Hire Cloud Managed Services?

### Robust Infrastructure

Cloud MSPs like Ayukul offer a powerful network infrastructure with round the clock administration. MSPs can also work on existing business practices working concurrently to manage your system and collaborate towards a common goal.

### Cost Savings

Hiring a full-time technical team to manage simple networks can be a hole in the pocket for small or medium businesses. However, Ayukul, can save a majority percentage of your total expense rather than spending it on an in-house team.

### Extends Other Cloud Models

The beauty of the cloud delivery model is to enable enterprises to run applications and store critical data instead of constructing an on-premise infrastructure. It also enables enterprises to extend other cloud models by outsourcing services, management, and support.

### Disaster Recovery

We have designed numerous networks and data centres with resiliency to remain in the continuity of the business. In the event of a disaster, your business operations can run smoothly and without any hiccup.

### Customized Cloud Services

Enterprises leverage these models to allow the customization of the software products accordingly. The partnership improves the quality of the customized services by delegating excellent computing resources along with 24 - 7 technical support.

### Specialized Delivery Model

The specialised model makes it much easier for companies to benefit with a variety of services without worrying about implementation and management.
